Figure S1: Breakthrough profiles from a simulation of solute loading at (A) 1 mg/ml, (B) 100 $\mu\text{g/ml}$, and (C) 10 $\mu\text{g/ml}$. Lines correspond to simulations with different K_{eq} , which increases by 4 orders of magnitude from left to right. Note that q_{max} was fixed at 100 mg/ml of packed column for all simulations, and the abscissa is on a logarithmic scale.

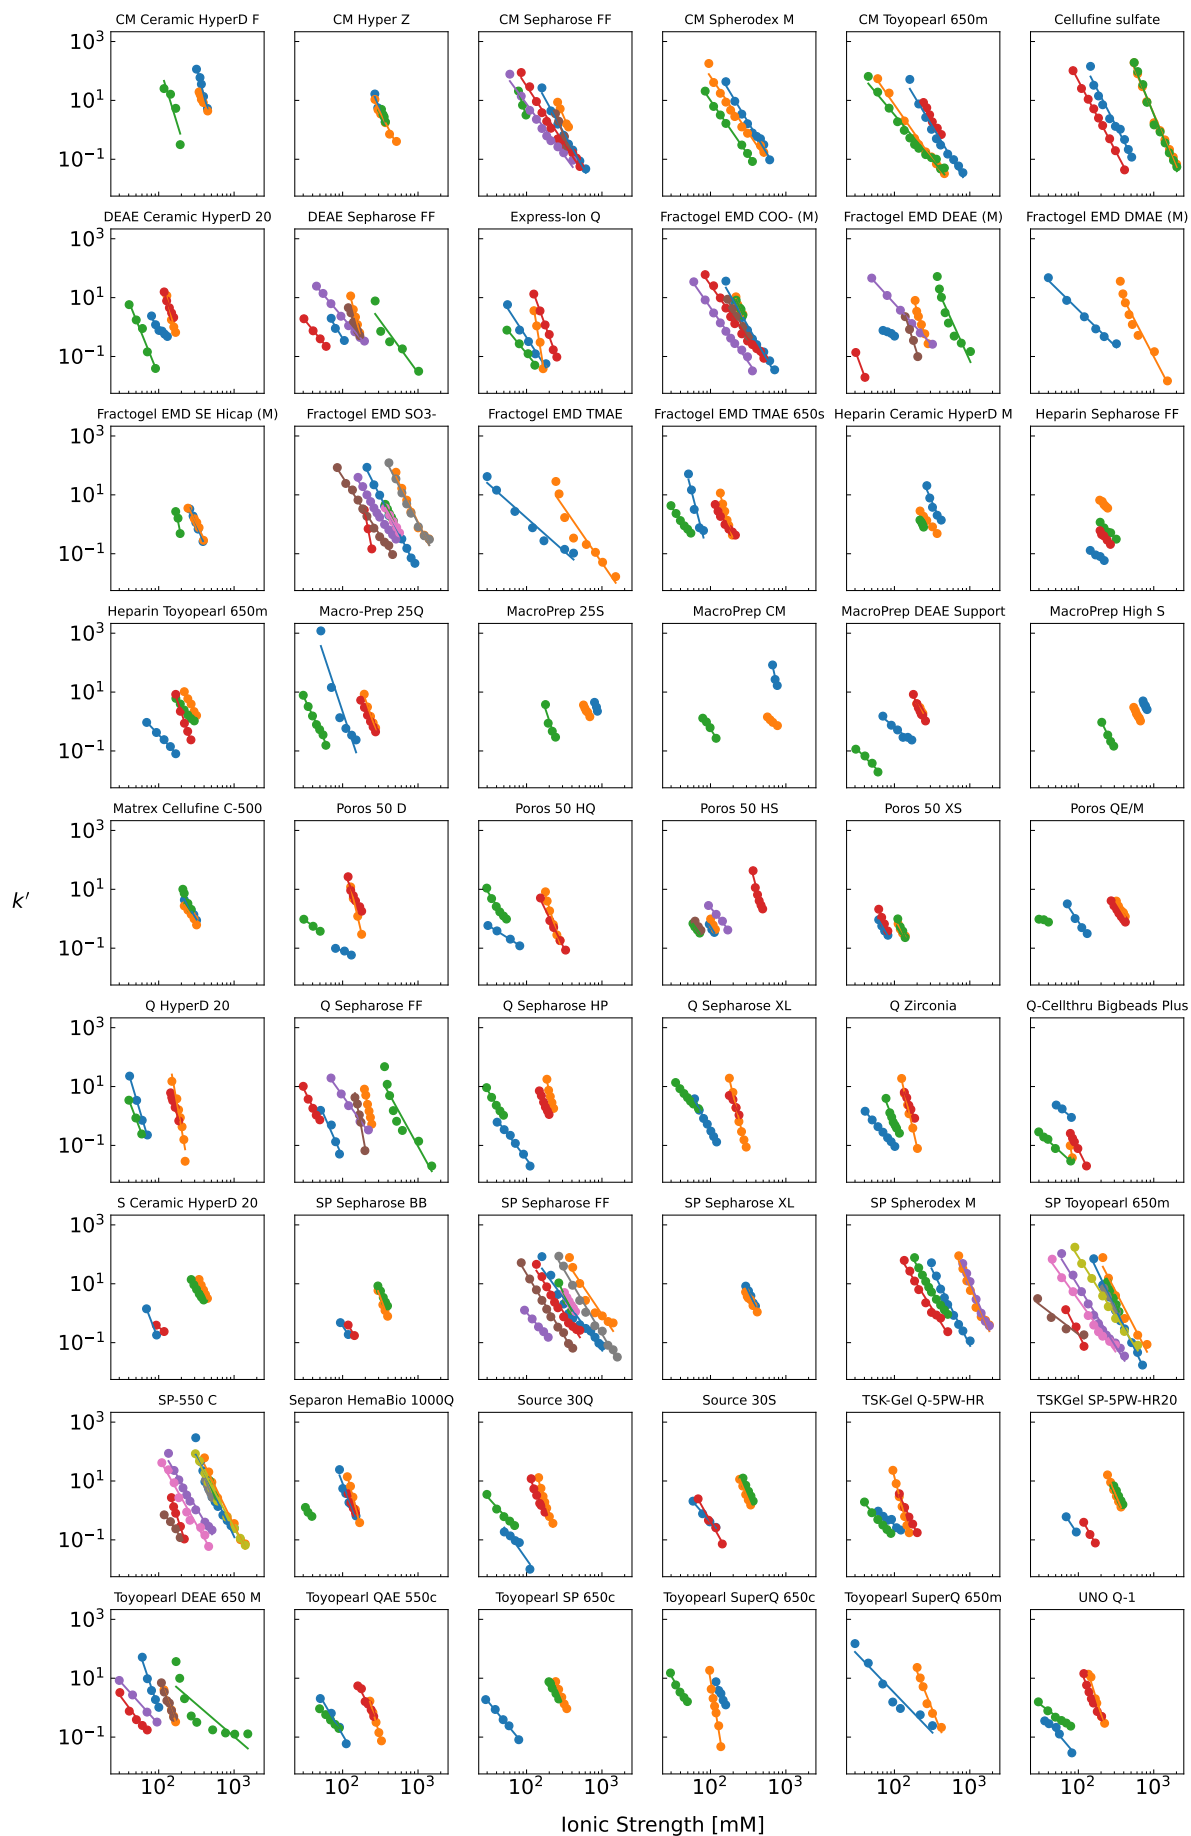

Figure S2: Isocratic k' data that were consolidated from the literature. Each series represents a unique protein-pH-resin combination, and lines represent quasi-SDM fits to the data. These data, which are available in the `Supplementary_table_S2.xlsx` file, were acquired by digitizing plots (using the Engauge Digitizer software), which may introduce some error into the precise k' values.

Table S1: Simulation parameters.
