**Behavior of weakly adsorbing protein impurities in  
flow-through ion-exchange chromatography**

**Figure S1:** Breakthrough profiles from a simulation of solute loading at (A) 1 mg/ml, (B) 100  $\mu\text{g/ml}$ , and (C) 10  $\mu\text{g/ml}$ . Lines correspond to simulations with different  $K_{eq}$ , which increases by 4 orders of magnitude from left to right. Note that  $q_{max}$  was fixed at 100 mg/ml of packed column for all simulations, and the abscissa is on a logarithmic scale.

**Figure S2:** Isocratic  $k'$  data that were consolidated from the literature. Each series represents a unique protein-pH-resin combination, and lines represent quasi-SDM fits to the data. These data, which are available in the [Supplementary\\_table\\_S2.xlsx](#) file, were acquired by digitizing plots (using the Engauge Digitizer software), which may introduce some error into the precise  $k'$  values.

**Table S1:** Simulation parameters.
